

Have you seen a Spotted Lanternfly?

Spotted lanternfly (*Lycorma delicatula*; SLF) is an invasive planthopper first detected in the United States in Pennsylvania in 2014. SLF feeds on over 70+ plant species, including fruits, ornamentals, and woody trees, with tree-of-heaven as its preferred host. There are several look-alike insects in Georgia, and SLF is often misidentified as one of these other common insects.

Be on the lookout for spotted lanternfly!
